a designing a finite state machine, worked out from start to finish. step 1: describe the machine in words. in
this example, we'll be designing a controller for an elevator. **test selection based on finite state models** -

the logical form of the sentence and the logical operators on these truth values. as an example, the sentence
in (1) could be represented with the logical form in (2), where prepresents the proposition "mary is sad" and
qrepresents the proposition that bill regrets that mary is sad (without its presupposition). **sequential logic**

state verification - gregory gay - finite-state verification express specification as a set of logical properties,
written as boolean formulae. exhaustively search the state space of the model for violations of those
properties. if the property holds - proof that the model is correct. contrast with testing - no violation might just
mean bad tests. **lyapunov stability of a class of discrete event systems ...** - lyapunov stability of a class
